1.1 Target Data System

There is no data to display.

1.2 Source Data System

There is no data to display.

2 Completeness Checks

2.1 Validation

Completeness checks (validation) evaluate the ETL (extract transform load) jobs. They compare for each variable the exact matching of the number of distinct values, the number of valid values (=n), and the number of missing values between the source data system and the target data system.

Variable	Check Distincts	Check Valids	Check Missings
Age in years	passed	passed	passed
Amount of credit	passed	passed	passed
Birthdate	passed	passed	passed
Credit worthy?	passed	passed	passed
Current bank balance	passed	passed	passed
Date of contact	passed	passed	passed
Forename	passed	passed	passed
Income	passed	passed	passed
Job	passed	passed	passed
Name	passed	passed	passed
Person ID	passed	passed	passed
Sex	failed	passed	passed

2.2 Verification

Variable	Missings [%] (source)	Missings [%] (target)
Age in years	0	0
Amount of credit	56.52	56.52
Birthdate	0	0
Credit worthy?	0	0
Current bank balance	0	0
Date of contact	0	0
Forename	0	0
Income	0	0
Job	0	0
Name	0	0
Person ID	0	0
Sex	0	0

3 Conformance Checks

3.1 Value Conformance

Value conformance checks (verification) compare for each variable the values of each data system to predefined constraints. Those constraints can be defined for each variable and data system individually in the metadata repository (MDR).

Variable	**Check Source Data**	**Check Target Data**
Age in years	passed	failed
Amount of credit	passed	passed
Birthdate	passed	passed
Credit worthy?	passed	passed
Current bank balance	failed	failed
Date of contact	passed	passed
Income	passed	failed
Sex	passed	failed
